NexaTech API Integration Guide

Department: Engineering | Document type: API Guide

Fictional training content for a document-based RAG learning project.

1. Authentication

The fictional API uses bearer tokens. Tokens should be stored in a secret manager and must not be committed to source control

2. Rate limits

The standard training tier allows 120 requests per minute per token. A 429 response indicates the client should back off and retry

3. Pagination

List endpoints use a cursor token. Clients should continue until the response contains no next_cursor value

4. Errors

400 indicates invalid input, 401 missing or invalid authentication, 403 insufficient permissions, 404 missing resource, and 500 server error

5. Versioning

API versions are included in the URL. Breaking changes are introduced only in a new major version
